

HR

LM Guide Separate Type (4-way Equal Load) Model HR

Point of Selection **A1-10**

Point of Design **A1-432**

Options **A1-455**

Model No. **A1-520**

Precautions on Use **A1-526**

Accessories for Lubrication **A24-1**

Mounting Procedure and Maintenance **B1-89**

Equivalent moment factor **A1-43**

Rated Loads in All Directions **A1-58**

Equivalent factor in each direction **A1-60**

Example of Clearance Adjustment **A1-261**

Accuracy Standards **A1-80**

Shoulder Height of the Mounting Base and the Corner Radius **A1-446**

Permissible Error of the Mounting Surface **A1-449**

Dimensions of Each Model with an Option Attached **A1-467**

Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off.

Because of the angular contact structure where two rows of balls rolling on the LM rail each contact the raceway at 45°, the same load can be applied in all directions (radial, reverse radial and lateral directions) if a set of LM rails and LM block is mounted on the same plane (i.e., when two LM rails are combined with an LM block on the same plane). Furthermore, since the sectional height is low, a compact and stable linear guide mechanism is achieved.

This structure makes clearance adjustment relatively easy, and is highly capable of absorbing a mounting error.

[Easy Installation]

Model HR is easier to adjust a clearance and achieve more accuracy than cross-roller guides.

[Self-adjustment Capability]

Even if the parallelism or the level between the two rails is poorly established, the self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed and smooth straight motion to be achieved even under a preload.

[4-way Equal Load]

When the two rails are mounted in parallel, each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in various orientations and in applications.

[Sectional Dimensions Approximate to Cross-roller Guides]

Since model HR utilizes endcaps for recirculation, cage/retainer creep cannot occur as with cross-roller guides. In addition, the sectional shape of model HR is approximate to that of cross-roller guides, therefore, its components are dimensionally interchangeable with that of cross-roller guides.

[Stainless Steel Type also Available]

A special type whose LM block, LM rail and balls are made of stainless steel is also available.

Types and Features

Model HR - Heavy-load Type

The LM blocks can be mounted from the top and the bottom.

Specification Table → [A1-264](#)

Model HR-T-Ultra-heavy Load Type

Has the same cross-sectional shape as model HR, but has a greater overall LM block length (L) and a higher load rating.

Specification Table → [A1-264](#)

Example of Clearance Adjustment

Design the clearance adjustment bolt so that it presses the center of the side face of the LM block.

- a. Using an adjustment screw
Normally, an adjustment screw is used to press the LM block.

- b. Using tapered gibs
When high accuracy and high rigidity are required, use tapered gibs 1) and 2).

- c. Using an eccentric pin
A type using an eccentric pin to adjust the clearance is also available.

Comparison of Model Numbers with Cross-roller Guides

Each type of LM Guide model HR has sectional dimensions approximate to that of the corresponding cross roller guide model.

Note) A moment in the direction M_c can be received if two rails are used in parallel. However, since it depends on the distance between the two rails, the moment in the direction M_c is omitted here.

The maximum length under "Length*" indicates the standard maximum length of an LM rail. (See **A1-268**.)

Static permissible moment*: 1 block: Static permissible moment value with one LM block mounted on two LM rails used on the same plane

Double blocks: Static permissible moment value with 2 blocks in close contact with each other on 2 LM blocks used on the same plane

Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model HR variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

Table1 Standard Length and Maximum Length of the LM Rail for Model HR

Unit: mm

Model No.	HR 918	HR 1123	HR 1530	HR 2042	HR 2555	HR 3065	HR 3575	HR 4085	HR 50105	HR 60125
LM rail standard length (L ₀)	70	110	160	220	280	280	570	780	1270	1530
	120	230	280	280	440	440	885	1020	1570	1890

Max length	300	500	1600	2200	3000	3000	3000	3000	3000	3000

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

Accessories

[Dedicated Mounting Bolt]

Normally, when mounting the LM block to adjust a clearance, use the tapped hole provided on the LM block to secure it as shown in Fig.2.

The holes of the bolt (d_1 and D_1) must be machined so that they are greater by the adjustment allowance.

If it is inevitable to use the mounting method as indicated by Fig.3 for a structural reason, the dedicated mounting bolt as shown in Fig.4 is required for securing the LM block. Be sure to specify that the dedicated mounting bolt is required when ordering the LM Guide.

Fig.2

Fig.3

Fig.4

Table2 Dedicated Mounting Bolt

Unit: mm

Model No.	S	d	D	H	L	ℓ	Supported model number

Greasing Hole

[Lubrication for Model HR]

The LM block has a greasing hole in the center of its top face. To provide lubrication through this hole, the table must be machined to also have a greasing hole as shown in Fig.5 and attach a grease nipple or the like. When using oil lubrication, it is necessary to identify the lubrication route. Contact THK for details.

Fig.5 Example of Machining a Greasing Hole
